DriWater, Inc. Products Contribute LEED Points for Water Use Reduction in Landscaping

Santa Rosa, CA – August 28, 2009 – As our ever-changing climate continues to become more pressing, landscape water efficiency is increasingly crucial. We are pleased to announce that DriWater, Inc.,™ the worldwide manufacturer of DRIWATER Time-Release Water® irrigation products for drought tolerant native plants, can now be considered a LEED product alternative for minimizing water usage in landscaping.

Through the cooperation of LEED certified consultants, we have identified DriWater as a water-reducing point generator in the categories of landscape renovation and new landscape construction.

LEED points for the use of DriWater products can assist in both saving the property owner money on utilities and in contributing to environmentally sustainable water management in landscaping.

Clients are not only able to potentially eliminate municipal irrigation needs, but also to earn up to 7 points towards the 70 point total needed for Platinum Certification under the new LEED certification Version 3 of the USGBC (US Green Building Council).

For additional information about how your project can earn LEED points with DriWater, contact sales team member Nate Miller, by e-mail at nate@driwater.com, or by phone at 707-206-1372.
