**FOR IMMEDIATE RELEASE**

**NEW PATENT ISSUED FOR DRIWATER INC. SPRAY ON PRODUCT**

*DriWater, Inc. has just announced issuance of a long awaited patent.*

Santa Rosa, CA -- August 9, 2004 -- DriWater, Inc., the worldwide manufacturer of DRiWATER, time-release water and other water technologies, is proud to announce that it has been issued it's third patent. The new patent, #6,688,038, issued on February 10<sup>th</sup> 2004, will put DRiWATER technology into yet another sector of the professional market. The mulch composition and method provides protection for DRiWATER spray on tackifier used in hydro seeding.

“We have waited for years to have this patent issued, and are excited to get this product into the market”, said President/ CEO Joseph Paternoster.

DriWater's patented technology holds more moisture to the seed than other products in this sector. Its patented formulation provides a more efficient application in difficult terrain, such as slopes or high wind areas. It allows for better water penetration into topsoil and provides oxygen exchange without rapid moisture evaporation. Its use can also contribute to erosion control by simply holding the soil in place.

Hydro seeding is a process of seeding with a mixture of water, cellulose and wood fiber mulch, seed, starter fertilizer, and tackifier (glue). These ingredients are mixed in a large tank and then sprayed into the loosened soil, creating a crust layer of mulch, seed, soil and tackifier. Holding the moisture in, using less water to establish the germinating seeds.

DriWater, Inc. has developed the commercial and retail market for DRiWATER in the United States and is working in more than 30 countries around the world. DRiWATER is turning deserts into forests, growing food where it was never possible and is conserving one of Earth's most precious resources – water.
